Barbagallo S., Massimino Cocuzza G.E. – Additions to the knowledge of the aphid fauna in the Veneto region, north eastern Italy (Hemiptera Aphidoidea)

An updated checklist of aphids detected in Veneto region (NE Italian peninsula) is reported. This list follows a previous one published in 1994, where 130 aphid species were checked for the same regional area. At present, our available data refer, as a whole, to the presence of 332 species, distributed into 106 genera. Six of the species reported are new records for the Italian aphid fauna. For each of the listed taxa short informative notes are given on their previous records (if any) in current literature and/or their collecting data (i.e. host plant species, localities and dates for each of the available samples). In addition, and whenever useful, more extensive faunistic information is given on a few of the most relevant species listed. Short accounts are added, at the end, on the regional biogeographical pattern of the listed aphid species as a whole.

KEY WORDS: Aphids survey, biodiversity, Veneto region, Italy.

INTRODUCTION

A first list of the aphid fauna of the north eastern Italian territory (Triveneto regional areas) was published more than twenty years ago (BARBAGALLO & PATTI, 1994). Here only 130 species of aphids were reported for the Veneto region, in spite of it covering a land area of 18.368 km² and showing a great abundance of both ecological habitats and floristic biodiversity (3295 vascular plant taxa, as listed in CONTI *et al.*, 2005). Consequently, additional field collections during more recent years easily increased the number of aphid taxa so far detected in the region. Furthermore, the search for older literature on the topic revealed an additional number of local aphid records, mainly on galligenous species, which were previously overlooked by us. Here we mention papers by some late Italian cecidologists, such as MASSALONGO C. or C.B. (1893, 1904, 1906a, 1906b), MASSALONGO O. (1891, 1896), TROTTER (1903, 1906), TROTTER & CECCONI (1900-1917), COBAU (1910, 1912, 1915), who recorded several aphid species for the Veneto region. More recently published general books in the field of applied entomology, occasionally issued about the relevant regional area (SERVADEI *et al.*, 1972; PELLIZZARI SCALTRITI, 1988; MASUTTI & ZANGHERI, 2001; BATTISTI *et al.*, 2013; POLLINI, 2013), give some species records or provide evidence about their regional distribution in Italy. In addition, we directly requested information from several entomologist colleagues, who kindly supplied us with useful information and data for the checking the occurrence of particular aphid species in the region, as acknowledged for each of the taxa involved.

Altogether, we gathered a large amount of faunistic data (either as informative records and/or from our direct field

collection) on about 200 additional species to the previous local checklist. This has enabled us to provide in the present paper a comprehensive list of 332 updated taxa for the Veneto region.

MATERIALS AND METHOD

Field collected aphid samples were temporarily stored in 70% ethyl alcohol. In order to be identified, samples were clarified and specimens mounted on permanent microscope slides (using Canada balsam as medium), following the currently used methodology for this group of soft-bodied hemipteran insects (BLACKMAN & EASTOP, 2000). In a few cases, which involve more common and easily identifiable field species, data were registered without the relevant sample collection. The samples were collected or registered in field from 1995 onward, as quoted for each of the species here listed. Additional samples occasionally come from gifts kindly given to us by local colleagues and scientists. Collected samples and their slides are stored in the collection of the senior co-author (S.B.). The regional map here reported (Fig. I) shows all the collecting sites of our samples, including those already listed in the previous paper by BARBAGALLO & PATTI (1994).

Host plants were mostly identified using the Italian flora books by PIGNATTI (1982), as well as the illustrated alpine flora books by AESCHIMANN *et al.*, (2005). Plant binomial nomenclature was updated, whenever necessary, following the Italian Vascular Flora checklist (Conti *et al.*, 2005).

Taxa known to us to date for the regional area are here reported, including their bibliographic records (if any) for each of the species listed. Field collection data are limited

to samples we collected from 1995 onwards (earlier data having been reported in the above-mentioned checklist by Barbagallo & Patti, 1994), except for a few samples gifted by other collectors.

RESULTS

In total, 332 aphid species or subspecies have now been recorded for the Veneto region, north-eastern Italy. Taxa are

here listed following the currently most used systematic arrangements for the Aphidoidea into families and subfamilies (REMAUDIÈRE & REMAUDIÈRE, 1997). Inside each group, genera follow the sequence used for the Italian checklist (BARBAGALLO *et al.*, 1995), while species are alphabetically listed according to their genera. Species names are mostly updated following BLACKMAN & EASTOP (2006) and FAVRET (2016). All taxa reported can be summarized as follows: Adelgidae, 6 genera and 8 species; Phylloxeridae, 2 genera and 2 species; Aphididae, 98 genera

and 322 species. The latter family is subdivided into: Eriosomatinae, 12 genera and 22 species; Mindariniae, 1 gen. and 1 sp.; Phloeomyzinae 1 gen. and 1 sp.; Anoeciinae, 1 gen. and 1 sp.; Thelaxinae, 1 gen. and 2 spp.; Phylaphidinae, 1 gen. and 1 sp.; Calaphidinae, 16 gen. and 32 spp.; Saltusaphidinae, 2 gen. and 3 spp.; Drepanosiphinae, 1 gen. and 4 spp.; Chaitophorinae, 3 gen. and 17 spp.; Lachninae, 6 gen. and 31 spp.; Pterocommatinae, 1 gen. and 3 spp.; Aphidinae Aphidini, 6 gen. and 74 spp.; Aphidinae Macrosiphini, 46 gen. and 130 spp.

For every species listed the main collecting data are given (host plants, localities and sampling dates), followed by bibliographic references. A few of the taxa reported are new records for the Italian aphid fauna.

LIST OF APHID SPECIES¹

Salvia pratensis, Arquà Petrarca - PD, 22.VI.16

Aphis sambuci Linnaeus, 1758

Sambucus nigra, Dolcè - VR, loc. Ceraino, 12.V.11 (G. Nardi leg.); Torreglia - PD, loc. Luvigliano, 22.VI.16; Fonte - TV, loc. Onè, 23.VI.16
Ref.: MASSALONGO, 1891

Aphis sanguisorbae Schrank, 1801

Sanguisorba officinalis, Farra d'Alpago - BL, Pian del Cansiglio, 17.IX.13

**Aphis solanella* Theobald, 1914
Solanum nigrum, Torreglia - PD, loc. Luvigliano, 22.VI.16
Ref.: MASSALONGO C., 1906b (as *A. rumicis* L. - misid.); COBAU, 1910 (as *Aphis rumicis*, partim, on *Solanum nigrum* - misid.); BARBAGALLO & PATTI, 1994; POLLINI, 2013

**Aphis spiraecola* Patch, 1914
Rhamnus utilis, Padua (Botanical Garden), 21.VI.16; *Carissa macrocarpa*, Padua (Botanical Garden), 5.X.16 (G. Pellizzari leg.)
Ref.: BARBAGALLO & PATTI, 1994

Aphis subnitida (Börner, 1940)
Pimpinella saxifraga, Erbezzo - VR, loc. Piano la Segà, 13.IX.04

Aphis taraxicola (Börner, 1940)
Taraxacum officinale, Auronzo di Cadore - BL, 19.IX.13; San Martino di Lupari - PD, loc. Campagnalta, 23.VI.16; Romano D'Ezzelino - VI, 23.VI.16

**Aphis thalictri* Koch, 1854
Ref.: BARBAGALLO et al., 1987; BARBAGALLO & PATTI, 1994

Aphis thermophila Börner, 1950
Helianthemum oelandicum, Solagna - VI, Mt. Grappa, 23.VI.16
Quoted as subspecies of *A. helianthemi* Ferrari by Blackman & Eastop, 2006

Aphis tormentillae Passerini, 1879
Potentilla reptans, Solagna - VI, Mt. Grappa, 23.VI.16

**Aphis tripolii* Laing, 1920
Ref.: HILLE RIS LAMBERS, 1934 (as *Doralis tripolii*)

Aphis umbrella (Börner, 1950)
Malva sylvestris, Galziglano Terme - PD, 22.VI.16
Ref.: MASSALONGO C., 1906a (as *A. malvae* Koch); COBAU, 1910 (as *Aphis urticae* F. su *Malva sylvestris* - misid.); COBAU, 1912 (as *Aphis malvae*)

**Aphis urticata* Gmelin, 1790
Urtica dioica, Galziglano Terme - PD, 22.VI.16
Ref.: MASSALONGO O., 1896 (as *Aphis urticae* F.); CARNIEL & MASUTTI, 1980; BARBAGALLO et al., 1987; BARBAGALLO & PATTI, 1994

Aphis verbasci Schrank, 1801
Buddleia davidii, Valstagna - VI, 23.VI.16; *Verbascum phlomoides*, Pedavena - BL, loc. Croce d'Aune, 18.IX.13

Aphis viburni Scopoli, 1763
Ref.: COBAU, 1912

Aphis vitalbae Ferrari, 1872
Clematis vitalba, Pedavena - BL, loc. Croce d'Aune, 18.IX.13

**Protaphis terricola* Rondani, 1847
Picris hieracioides, Erbezzo - VR, loc. Passo Fittanze della Segà, 13.IX.04

**Brachyunguis tamaricis* (Lichtenstein, 1885)
Tamarix gallica, Porto Viro - RO, loc. Ca' Giustinian, 22.VI.16
Ref.: HILLE RIS LAMBERS, 1934 (as *Doralis tamaricis*)

n. Aphidinae *Macrosiphini*

**Cryptosiphum artemisiae* Buckton, 1879
Artemisia vulgaris, Padua, sine data (G. Pellizzari, pers. comm.)
Ref.: MASSALONGO C.B., 1893 (as *Aphis gallarum*); MASSALONGO O., 1896 (as *A. gallarum* Kaltenbach); TROTTER & CECCONI, 1900-1917 (sheet n° 213 - *Cryptosiphum gallarum*); COBAU, 1910;

Ceruraphis eriophori (Walker, 1848)
Viburnum lantana, Cesiomaggiore - BL, 18.IX.13

Nearctaphis bakeri (Cowen, 1895)
Trifolium pratense, Torreglia - PD, 22.VI.16; Galziglano Terme - PD, 22.VI.16

Anuraphis catonii Hille Ris Lambers 1935
Pimpinella saxifraga, Erbezzo - VR, loc. Piano la Segà, 13.IX.04

Anuraphis farfarae (Koch, 1854)
Petasites paradoxus, Cortina d'Ampezzo - BL, 19.IX.13; *Tussilago farfara* Erbezzo - VR, loc. Passo Fittanze della Segà, 13. IX.04
Ref.: POLLINI, 2013

Anuraphis pyrilaseri Shaposhnikov 1950
Laserpitium siler, San Vito di Cadore - BL, 19.IX.13

Anuraphis subterranea (Walker, 1852)
Heracleum sphondylium, Gosaldo - BL, loc. Tiser, 18.IX.13

Dysaphis apiifolia (Theobald, 1923)
Peucedanum verticillare, Erbezzo - VR, loc. Piano la Segà, 13.IX.04
Ref.: ROBERTI, 1993; BARBAGALLO et al., 1987

Dysaphis brancai (Börner, 1950)
Malus domestica, Verona, 26.V.96 (M. Ciampolini leg.)
Ref.: CIAMPOLINI et al., 1997

**Dysaphis crataegi* (Kaltenbach, 1843)
Heracleum sphondylium, Fregona - TV, 17.IX.13; Pedavena - BL, loc. Croce d'Aune, 18.IX.13
Ref.: MASSALONGO C.B., 1893 (as *Aphis crataegi*); MASSALONGO O., 1896 (as *A. crataegi*); TROTTER & CECCONI, 1900-1917 (sheet n° 60 - as *Aphis crataegi*); PELLIZZARI SCALTRITI, 1988; POLLINI, 2013

Dysaphis devecta (Walker, 1849)
Malus domestica, Agordo - BL, 18.IX.13 (empty galls)

Dysaphis lappae (Koch, 1854)
Arctium lappa, Romano d'Ezzelino - VI, loc. S. Giacomo Fellette, 23.VI.16

**Dysaphis radicola* (Mordvilko, 1897)
Rumex crispus, Pedavena - BL, loc. Croce d'Aune, 18.IX.13
Ref.: BARBAGALLO & PATTI, 1994

- Dysaphis tulipae* (Boyer de Fonscolombe, 1841)
Iris germanica, Auronzo di Cadore - BL, 19. XI.13;
 Cinto Euganeo - PD, loc. Faedo, 22.VI.16
Dysaphis (Pomaphis) ariae Börner, 1950
 Ref.: COBAU, 1915 (as unid. "Aphididae", probably to be attributed to the postulated species)
- **Dysaphis (Pomaphis) plantaginea* (Passerini, 1860)
Malus domestica, Agordo - BL, 18.IX.13

ADDITIONAL NOTES ON MOST REMARKABLE SPECIES CHECKED

Additional remarks are here given on a small group of species which we estimate to be of major local faunistic interest, as they are new aphid records for Italy or because they are uncommon and therefore hardly recorded in Italian aphidological literature.

***Aloephagus myersi* Essig.** Prof. G. Pellizzari (University of Padua) kindly gave us the gift of two samples of this aphid, both collected on different *Aloe* species (see data in the checklist); the latter are grown on her sheltered balcony in Padua, where recurrent infestations have been occurring annually since 2009. The aphid was until then recorded in Italy for the two southern regions of Campania and Sicily only (MICIELI DE BIASE, 1988; BARBAGALLO *et al.*, 1995; PATTI & BARBAGALLO, 1997). Therefore, its detection for Veneto region is the most northern record for the Italian peninsula. *A. myersi* usually lives anholocyclically in warmer climates and needs protected habitats (greenhouses or other sheltered places) to survive the winter period in colder ones. Not rarely is it noxious to the infested host plants (commonly Liliaceae of genera *Aloe*, *Gasteria* and other allied ones), on which heavy and myrmecophilous colonies develop at leaf bases of their apical shoots. The taxon is believed to be native of the Mediterranean-Afrotropical biogeographical region (as other Fordini are), where it is widely distributed and was accidentally introduced into North America, Japan and Australia with its ornamental host plants. It is strongly suspected that the aphid can also develop a heteroecious life cycle somewhere in Africa, using *Pistacia aethiopica* as primary host plant, as noted by BLACKMAN & EASTOP (2006). HILLE RIS LAMBERS (1956) discussed the relationships of *Aloephagus* to allied aphid genera, while Essig (1950, 1952) and Roberti (1996) provided good illustrations of the morphology of parthenogenetic morphs.

***Aphis cirsiioleracei* (Börner).** This small aphid, reported as holocyclic and monoecious on *Cirsium oleraceum* and *C. pannonicum* (see Börner, 1952, as *Cerosiphia*), has not yet been collected by us in Italy. Nevertheless, it was reported by TROTTER (1906) and COBAU (1910) as an unidentified 'Aphididae' on deformed leaves of *C. oleraceum*. The two cecidologists collected their samples at Vittorio Veneto – TV, along the Meschio River and at Oliero – VI and Solagna – VI (Brenta Valley), respectively. Both authors, although they did not identify the aphid species, reported a short and efficient description of leaf deformations on *C. oleraceum* which helped us to recognize them as pseudogalls produced by *A. cirsiioleracei*. Furthermore, the leaf samples collected by Trotter are available as *exiccata* in the gall collection series of TROTTER & CECCONI (1900–1917), of which sheet n. 392 contains two leaves of *C. oleraceum* damaged by *A. cirsiioleracei* (as seen by the senior coauthor in the herbarium collection of Botanical Garden, University of Turin). *A. cirsiioleracei* is recorded from several countries in Europe (BLACKMAN & EASTOP, 2006).

***Aphis althaeaev* Neovsky.** A small sample (two apterae and a few immature ones) of this aphid was collected by us in the area of Venice lagoon on its most typical host plant, *Althaea officinalis*. The aphid is a pale green or yellowish-green rather small species, which colonizes and deforms tender apical parts (leaves and flower stems) of its host

plants (usually Malvaceae of the genera *Althaea*, *Alcea* and *Malva*). This aphid is recorded here for the first time in Italy, in spite of its main host plant, *A. officinalis*, being distributed in all Italian regions from north to south of the peninsula and isles (though limited to peculiar and rather humid habitats; see PIGNATTI, 1982). The aphid is usually monoecious and holocyclic (perhaps anholocyclic in warmer climates). It is widespread in several countries of the Euro-Asiatic biogeographical region (BLACKMAN & EASTOP, 2006). HILLE RIS LAMBERS (1966a) proposed the new name *A. davletshinae*, because the name *A. althaeaev* was already taken by *A. althaea* Harris (=nomen dubium); nevertheless, the validity of Nevsky's name was discussed by GARCIA *et al.*, 2004.

For an extensive description of apterous and alate viviparous females see Nieto NAFRÍA *et al.* (2005).

***Aphis subnitida* (Börner).** Another yet unrecorded *Aphis* species for Italy, collected on the basal part (root collar and leaf bases) of *Pimpinella saxifraga* (Apiaceae). It is a holocyclic-monoecious aphid, black greenish in color and infesting different species of the genus *Pimpinella* in several W European countries eastwards to Siberia. Morphological details are given by HEIE (1986) and Nieto NAFRÍA *et al.* (2005). A typical feature of this species is the presence of a number of secondary rhinaria on III-V antennal joints both in alate and apterous viviparous morphs, as quoted by Börner (1940) in his short original description (as *Doralis subnitida*).

***Neotoxoptera formosana* (Takahashi).** This anholocyclic and mainly tropical and subtropical aphid species was detected for the first time in Italy in Veneto region (at Oppeano, near Verona), where it heavily infested chive cultivations (*Allium schoenoprasum*) in a quite extensive greenhouse, with consequential plant loss (BARBAGALLO & CIAMPOLINI, 2000). The aphid then disappeared and no further infestations, as far as we know, were detected in the same area or elsewhere in Italy. This quite peculiar behavior is apparently usual for this aphid species when occasionally introduced into habitats (countries) not suitable to allow its definitive colonization. Therefore, the same aphid has been recorded for detection (frequently on sets of stored *Allium* bulbs) in different countries in Europe (Finland, France, United Kingdom, Germany, The Netherlands), then not followed by its establishment in the places (BLACKMAN & EASTOP, 2000; Piron, 2010). Host plant range of *N. formosana* is restricted to genus *Allium*, including cultivated and wild species. Strictly allied in morphology are *N. violae* (Pergande) and *N. oliveri* (Essig) - for separation and further information see Carver (1980), Patti & Barbagallo (1999) and BLACKMAN & EASTOP (2006).

***Tuberoccephalus (Trichosiphoniella) tianmushanensis* Zhang.** This interesting aphid of Asiatic origin was recently recorded for Italy (Veneto region) by PELLIZZARI & FRIGIMELICA (2014). These coauthors detected it at the Botanical Garden, University of Padua, and afterwards in a few plant nurseries, on ornamental plants of *Prunus subhirtella* cv. *pendula*. They gave accounts on the aphid synonymy, taxonomy and behavior, and made attempts to detect its secondary host plant and life cycle in Italy. *T. tianmushanensis* is widespread in East Asia (Japan, China, Korea) where it is known as a heteroecious aphid, having *Prunus* spp. (mostly of cherry group) as primary host, on which marginal leaf galls are produced. As secondary host plants *Artemisia* spp. (including *A. vulgaris*) are reported;

here the aphid sets up its colonies on the basal parts of plants (collar roots and runners). For further information on this aphid group see REMAUDIÈRE & SORIN (1993) and Sorin (1993).

Hyperomyzus (Neonasonovia) zirnitsi ssp. boernerii Prevost. This taxon belongs to a small group of three strictly allied species of *Hyperomyzus* subgen. *Neonasonovia*, of which *H. zirnitsi* Hille Ris Lambers s. str. is a heteroecious species, alternating between *Ribes*, as primary host, and *Euphrasia*; conversely, its subspecies *boernerii* Prevost and *H. thorsteinni* Stroyan (originally described as a subsp. of *H. boernerii*: see STROYAN, 1960, 1972) are monoecious on *Euphrasia*. Indeed, *H. boernerii* was described by PREVOST (1959) as a full species on the basis of its parthenogenetic (apterous and one intermediate alate female) and amphigonic morphs (oviparous female and alate male) from material collected in Austria and Switzerland. The presence of the latter morphs on *Euphrasia* evidenced that the aphid was clearly monoecious holocyclic on the same host plant. Thereafter, the taxon was quoted as a synonym of *H. zirnitsi* both in the Survey (EASTOP & HILLE RIS LAMBERS, 1976) and the Catalogue (REMAUDIÈRE & REMAUDIÈRE, 1997). Nevertheless, Heikinheimo (1990), while he described the alate viviparous of *H. boernerii* collected in Finland, proposed to re-establish it as a valid taxon at the rank of subspecies at least. For the separation of the two subspecies, see the key to *Euphrasia* infesting aphid species in BLACKMAN & EASTOP (2006). Our small sample (a few apterous viviparous and immature specimens) of *H. zirnitsi* ssp. *boernerii* from Veneto region was collected on *E. rostkoviana* in mixed colonies with *Nasonovia ribisnigri* (Mosley), living on the same host plant.

***Impatientinum asiaticum* Nevsyky.** Heavy colonies of this aphid were collected on flower stems of *Impatiens glandulifera* in Veneto region, along the banks of a stream where big bushes of this host plant were growing. *I. asiaticum* is of Central Asiatic origin and appeared in Western Europe at the beginning of the '70s as quoted by HOLMAN (1971) who collected the aphid on *I. parviflora* in the former Czechoslovakia. He described all aphid morphs and compared their morphology to that of the very similar *I. balsamines* (Kaltenbach), native of W Europe where it lives on *Impatiens noli-tangere*. *I. asiaticum* was recorded for the first time in Italy by BARBAGALLO *et al.*, (2009) in a footnote and jointly with other new aphid records for Italy, but without giving collecting data. The aphid was seen indeed by the senior author in two or three other regions in Italy on *I. parviflora*, where it is likely distributed around all the northern side areas. The distribution of *I. asiaticum* in W Europe covers at present several countries (HEIE, 1994; BLACKMAN & EASTOP, 2006).

***Macrosiphum knautiae* Holman.** This taxon belongs to the group of *M. rosae* (Linnaeus), which is inclusive of *M. silvaticum* Meier and *M. weberi* Börner, all living on Dipsacaceae (the former species alternating with *Rosa* spp. as primary host). Our only sample available to date of *M. knautiae* from Veneto region is of two apterous viviparous females and a few nymphs, collected on a tender shoot of *Knautia drymeia*, its most typical host plant species. The taxonomy of the group is quite interesting. HOLMAN (1972) gives morphological details of all *M. knautiae* morphs, comparing two different populations: one from the Czech Republic (Moravia) living on *K. drymeia* and a second one

from Switzerland collected on *K. sylvatica*. He discussed the morphological relationships of all species-groups [among which he also included *M. funestum* (Macchiat) and *M. albertinae* Hille Ris Lambers], pointing out that the two *M. knautiae* populations examined could represent distinct subspecies. Thereafter, MEIER (1985) while investigating on the Swiss population of *M. knautiae*, regarded it as a separate taxon, which he named as *M. silvaticum*. In more recent years, Rakauskas (2003), comparatively analyzing the two taxa, *M. knautiae* and *M. silvaticum*, came to the conclusion that the latter species should be considered as a synonym of the former species. BLACKMAN & EASTOP (2006) maintain the previous taxonomic status and give a key to separate the *Macrosiphum* species group living on *Knautia*.

CHOROLOGICAL REMARKS

The chorological pattern of the above-listed species shows a large prevalence of species with a wide biogeographical distribution, such as Cosmopolitan (including sub-cosmopolitan) distributed taxa (21.4%), Holarctic (31.3%) and Palaearctic species (19.9%). Against this large number of widely-distributed representatives are those species with a more restricted European distribution (24.4%) and a very small group of taxa (about 3%) which can be attributed to a Mediterranean-like geomemy. This general pattern of geographic distribution, if compared to that of the corresponding categories of the Italian aphid fauna as a whole (BARBAGALLO *et al.*, 2009), shows a lower percentage of European and Mediterranean distributed species (27.4%, against 34.7% for Italy) compared to the more widely distributed species (i.e. Cosmopolitan, Holarctic and Palaearctic taxa, which amounts to 72.6% for Veneto region and 61.4% for Italy, respectively). Therefore, it can be argued that further faunist research on aphid fauna in Veneto region should improve the aphid list of additional European distributed species, perhaps linked to more peculiar ecological habitats.

CONCLUSION

The aphid fauna of Veneto administrative region (NE Italy) is so far represented by 332 species, as results both from numerous records from bibliographic references and field collecting data. This amount of aphid taxa is undoubtedly rather small if compared to that of other previously investigated administrative regions of Italy (i.e. Lombardy, Emilia Romagna, Sicily), where more than four hundred species were detected. As a consequence, it can be expected that further faunistic research for this region should easily improve the local aphid fauna biodiversity, due to its extent and the richness of its ecological habitats.

ACKNOWLEDGEMENTS

Coauthors are indebted to Prof. Giuseppina Pellizzari (Dept. DAFNAE – Entomology Section, University of Padua) for the gift of several aphid samples, collecting data on a number of species and bibliographic information. Many thanks are also due to Prof. Andrea Battisti, Prof. Luigi Masutti (Dept. as above, University of

Padua) and Prof. Alessandro Minelli (Dept. of Biology, University of Padua) for their appreciated information about aphid species mainly of forestry interest; to Dr. Paul Brown (The Natural History Museum, London) for the loan of aphid slides for comparison; to Dr. Laura Guglielmone (Dept. of Life Sciences & Systems Biology – Botany Section (Herbarium TO) University of Turin) for the access to the *exiccata* of galls collection of Cecidothea Italica by Trotter & Cecconi (1900 – 1917). Grateful thanks are finally deserved to the two anonymous reviewers for their suggestions and improvement to the manuscript.

RIASSUNTO

Viene riportata una checklist degli afidi della regione Veneto, dove i dati sinora disponibili evidenziano la presenza complessiva di 332 specie. Queste sono ripartite per gruppi sistematici ed evidenziano, per ciascun taxon, i riferimenti bibliografici regionali a nostra conoscenza, nonché i dati dei nostri riscontri di campo. L'elenco riportato fa seguito a una precedente lista (BARBAGALLO & PATTI, 1994) nella quale, per la stessa regione, era stata evidenziata la presenza di 130 specie. Il presente lavoro rappresenta pertanto un contributo integrativo e di aggiornamento bibliografico sull'afidofauna della regione in oggetto. Per alcune specie di maggiore rilevanza locale, fra le quali sei di nuova segnalazione per l'Italia, vengono date notizie integrative di contenuto tassonomico e/o biogeografico. Si aggiungono infine brevi considerazioni biogeografiche, comparando i dati regionali con quelli più generali dell'afidofauna italiana nel suo insieme.
